

Firewall

Layer 7 Application Control

With Smoothwall Firewall, you get everything you need without everything you don't.

Problematic applications such as BitTorrent, Skype, and TOR can compromise available bandwidth and expose you to inappropriate and illegal activity. Using protocols that aren't identified by conventional web filters, these types of applications are difficult to stop.

Smoothwall's Firewall allow you to stop this traffic at the gateway. Using Deep Packet Inspection we are able to identify over 100 different kinds of traffic — even when it doesn't want to be identified.

For a more comprehensive web security solution, take a look at Smoothwall UTM. It integrates all the benefits of our firewall with content-aware filtering.

Stateful Packet Inspection

VLAN Trunking

Integration with Authentication

Internal Firewall Including DMZ

Next-generation,
Deep-packet
Inspection
